

CWSRF:

A Flexible Tool for Advancing Clean Water

ECOS Webinar on Innovative Uses of CWSRF February 10 at 2:00—3:30 Eastern

The webinar features three projects demonstrating unique uses and dispersion of CWSRF funds, and offers valuable case studies that will build state capacity and knowledge. The webinar is open and relevant to all levels of government, utilities, and NGOs. Presentations will include:

A state-wide project in Montana minimized the need for plant upgrades through targeted education of wastewater treatment operators and some additional site-specific assistance.

The City of West Monroe, Louisiana upgraded an existing wastewater treatment plant to meet the water needs of a nearby manufacturer. The City worked closely with the manufacturer to identify, test, and implement this innovative solution to the company's industrial input needs.

A Camden City, New Jersey project implemented various green and grey infrastructure projects to address stormwater and combined sewer issues through a partnership between the Camden County Municipal Utilities Authority and other governmental entities and non-profits.

Registration

Email Layne Piper at lpiper@ecos.org with questions or to obtain registration information.

This webinar is being held by the Environmental Council of the States under a cooperative agreement with U.S. EPA to highlight the flexibilities in the CWSRF.
